User's Manual
Read this manual before installing and operating the Micropulse Transducer.

1.1 Proper application

The BTL5 Micropulse transducer is intended to be installed in a machine or system. Together with a controller (PLC) or a processor it comprises a position measuring system and may only be used for this purpose.

Unauthorized modifications and non-permitted usage will result in the loss of warranty and liability claims.

1.2 Qualified personnel

This guide is intended for specialized personnel who will perform the installation and setup of the system.

1.3 Use and inspection

The relevant safety regulations must be followed when using the transducer system. In particular, steps must be taken to ensure that should the transducer system become defective no hazards to persons or property can result. This includes the installation of additional safety limit switches, emergency shutoff switches and maintaining the permissible ambient conditions.

1.4 Scope

This guide applies to the model BTL5-S1...-M...HB/WB... Micropulse transducer.

An overview of the various models can be found in chapter 6 Versions (indicated on part label) on page 7.

Note: For special versions, which are indicated by an -SA_ _ _ designation in the part number, other technical data may apply (affecting calibration, wiring, dimensions etc.).
2.1 Characteristics

Micropulse transducers feature:
- High data security: Output data are checked for validity and plausibility in the µC.
- Very high resolution, repeatability and linearity
- Absolute output signal
- Measurement range monitoring with "Out of Range" Bit 221.
- Immunity to shock, vibration, and contamination
- Tough assembly
- Housing of stainless steel
- Wear- and maintenance-free measuring principle
- Pressure rated to 600 bar
- Teflon cable
- Capability of connecting cable guard systems
- Enclosure rating per IEC 60529: Cable version IP 68 (type tested at 5 bar / 48 h)

2.2 Function

The transducer contains a tubular waveguide enclosed by an outer stainless steel rod. A magnet attached to the moving member of the machine or to the cylinder piston is moved over the rod and its position constantly updated.

The magnet defines the measured position on the waveguide. An internally generated INIT pulse interacts with the magnetic field of the magnet to generate a magnetostrictive torsional wave in the waveguide which propagates at ultrasonic speed.

The torsional wave arriving at the end of the waveguide is absorbed in the damping zone. The wave arriving at the beginning of the waveguide creates an electrical signal in the coil surrounding the waveguide. The corresponding value is output as synchronous serial data (SSI) via the RS 485/422 interface. This takes place with high precision and repeatability within the measuring range indicated as the nominal stroke length.

At the rod end is a damping zone, within which no reliable signal is available, but which may be entered by the magnet.

2.3 SSI interface

Depending on the BTL version, the SSI interface uses 24 or 25 bits and the position values are transmitted in Gray or binary code. The max. clock frequency \( t \) depends on the cable length section 8 Technical Data on page 9.

For the purposes of error detection bit 221 is provided as an "Out of Range" message, Fig. 2-1 and Fig. 2-2.

Sending of the position values is finished within time \( t_m \). It is started with the falling edge of the last clock pulse. After this time the BTL is ready for the next data transmission.

Fig. 2-1: Pulse diagram, example with 24 bit coding

Only for resolution \( \geq 5 \, \mu m \)

Position of magnet:
1) out of the measurement range
2) within the measurement range
3) magnet not present

"Out of Range" Bit 221 will be set after the occurrence of the event.

Value of the output data 21 ... 220:
1a) 0
1b) max. at end point + 10 mm
2) proportional to distance
3) 0

Technical data are valid within the measurement range only, i.e. between null and end point.

**Important Installation Notes:**

The contact surface of the transducer must be completely contacted by the mounting surface. The O-ring supplied must make a perfect pressure seal, i.e. the bevel for the O-ring must be configured exactly as shown in Fig. 3-3.

To achieve secure mounting, use the proper nut for the mounting thread. When tightening the transducer, do not exceed a tightening torque of 100 Nm.

For horizontal mounting of transducer with stroke lengths greater than 500 mm, the pressure tube should be supported or attached at its end.

When installing in a hydraulic cylinder, do not allow the magnet ring to rub against the pressure tube. The bore diameter in the piston and cylinder rod should be at least 13 mm.
3 Installation (cont.)

3.1 Mounting

When possible, use non-magnetizable material for attaching the transducer and magnet ring. Fig. 3-2.

When attaching the transducer to magnetizable materials, appropriate measures must be taken to protect against magnetic disturbances. Fig. 3-2. Note the recommended distance of the transducer and cylinder from strong, external magnetic fields.

Fig. 3-2: Mounting

3.2 Transducer, Installation

The smallest permissible distance between magnet ring and rod mounting surface is shown in Fig. 3-1.

The transducer has either a M18×1.5 thread or a 3/4"-16UNF thread for mounting. The sealing is carried cut with the O-ring supplied at the flange facing.

Fig. 3-3: Threaded hole for mounting the BTL with O-ring
3 Installation (cont.)

3.3 Magnets, Installation

A magnet is required for each transducer. This must be ordered separately.

For mounting the magnet we recommend to use non-magnetizable material. Fig. 3-2.

4 Wiring (cont.)

Note the following when making electrical connections:

System and control cabinet must be at the same ground potential.

To ensure the electromagnetic compatibility (EMC) which Balluff warrants with the CE Mark, the following instructions must be strictly followed.

BTL transducer and the processor/control must be connected using shielded cable.

Shielding: Copper filament braided, 85 % coverage.

The cable shield must be grounded on the control side, i.e., connected to the protection ground.

Pin assignments can be found in Table 4-1. Connections on the controller side may vary according to the controller and configuration used.

To avoid coupled noise, avoid proximity to high-current lines when routing cable between transducer, controller and power supply. Inductive coupled noise from AC harmonics (e.g., from phase controls) are especially critical, against which the cable shield offers very little protection.

4.1 Cable axial and radial

Cable length max. 400 m; Ø 6 to 8 mm. Longer lengths may be used if construction, shielding and routing are such that external noise fields will have no effect on signal integrity.

Caution! False data will result from reversing the +Clk and –Clk inputs.

Colors | BTL5-S1...
---|---
Interface signals | 
YE yellow | +Clk
PK pink | –Clk
GY gray | +Data
GN green | –Data
BU blue | GND
BN brown | +24 V
WH white | do not connect

Table 4-1: Wiring
5 Startup

5.1 Check connections
Although the connections are polarity reversal protected, components can be damaged by improper connections and overvoltage. Before you apply power, check the connections carefully.

5.2 Turning on the system
Note that the system may execute uncontrolled movements when first turned on or when the transducer is part of a closed-loop system whose parameters have not yet been set. Therefore make sure that no hazards could result from these situations.

5.3 Check output values
After replacing or repairing a transducer, it is advisable to verify the values for the start and end position of the magnet in manual mode. If values other than those present before the replacement or repair are found, a correction should be made.
* Transducers are subject to modification or manufacturing tolerances.

5.4 Check functionality
The functionality of the transducer system and all its associated components should be regularly checked and recorded.

5.5 Fault conditions
When there is evidence that the transducer system is not operating properly, it should be taken out of service and guarded against unauthorized use.

6 Versions (indicated on part label)

6.1 Included in shipment
Transducer with condensed guide

6.2 Available lengths
Nominal stroke lengths of from 25 to 4000 mm are available for ideally sizing the transducer to the application.
7 Accessories (order separately)

7.1 Magnets

Magnet BTL-P-1013-4R, BTL-P-1012-4R

Dimensions ➤ Fig. 3-4
Weight approx. 10 g
Housing anodized aluminum
Operating temp. –40 °C to +85 °C
Spacer 8 mm
Material POM (Polyoxymethylene)

Magnet BTL-P-1014-2R

Dimensions ➤ Fig. 3-4
Weight approx. 10 g
Housing anodized aluminum
Operating temp. –40 °C to +85 °C

Magnet BTL-P-0814-GR-PAF

Dimensions ➤ Fig. 3-4
Weight approx. 2 g
Housing Polyamide bound ferrite
Operating temp. –40 °C to +85 °C

7.2 Compatible devices

Display:
BDD-AM10-1-SSI display and limit controller with 2 relay outputs

7.3 Mounting nut

BTL5...-HB...
Mounting nut M18x1.5
BTL-A-FK01-E-M18x1.5

BTL5...-WB...
Mounting nut 3/4"-16UNF
BTL-A-FK01-E-3/4"-16UNF
Typical values at DC 24 V, room temperature and BTL with nominal length of 500 mm. Ready for operation at once, full accuracy after warm-up. With magnet BTL-P-1013-4R, BTL-P-1014-2R or BTL-P-1012-4R:

8.2 Supply voltage (external)
Regulated supply voltage
BTL5...1... 20 to 28 V DC
Ripple ≤ 0.5 Vpp
Current draw ≤ 90 mA
Inrush ≤ 3 A/0.5 ms
Polarity reversal protection built-in
Overvoltage protection
Transzorb diodes
Electric strength
GND to housing 500 V DC

8.3 Control signals
Interface RS 485/422
Clock input: +Clk, −Clk
_CLK
(max. 1000 kHz)
Output data +Data, −Data
Position information 24 or 25 bit serial

8.4 Connection to processor
BTL5...-FA05
with connecting cable, axial arrangement, 5 m long
BTL5...-F05
with connecting cable, radial arrangement, 5 m long
Teflon cable -40 °C to +200 °C

The clock frequency is a function of the cable length:

<table>
